

Our Water Quality Commitment:

You Can Count on Washington Water Employees to . . .

- ⇒ provide you with the highest quality water possible
- ⇒ sample, test and treat your water on a regular basis
- ⇒ work diligently to meet every water quality standard on every system, every day
- ⇒ maintain water distribution system reliability
- ⇒ provide you with the highest level of customer service possible

Important Phone Numbers:

WASHINGTON WATER SERVICE COMPANY

Burns Point Water System State ID #09650M

2009 Drinking Water Report

Washington Water Service Company (WWSC) is committed to being a leader in providing communities and customers with traditional and innovative utility services. WWSC is proud of its service record and is staffed with courteous and knowledgeable water professionals who are dedicated to meeting your needs. While we are proud of our past record, we continually strive to improve upon the quality of services we provide to you, our valued customer.

This **2009 Drinking Water Report** is your annual update on the quality and safety of your drinking water. It includes any new water quality test results obtained in 2009 or the *most recent* results of tests conducted over the last 5 years (not all testing is required every year). **All three wells meet all applicable EPA and Department of Health standards.**

This report also provides access through references and telephone numbers to source water assessments, health effects data and additional information about your water system. This allows you to make personal health-based decisions regarding your drinking water consumption and become more involved in decisions which may affect your health.

If you have questions about your water quality, please contact Lynn Coleman at **866-5215**.

Regarding “contaminants” in drinking water:

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. In order to ensure that tap water is safe to drink, the Washington State Department of Health and EPA prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. The Food and Drug Administration (FDA) and the Washington Department of Agriculture regulations establish limits for contaminants in bottled water that must provide the same protection for public health.

Sources of drinking water:

Common sources of drinking water—both tap and bottled water—include rivers, lakes and streams (surface water) and wells and springs (groundwater). As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material. The water can also pick up substances resulting from the presence of animals or from human activity.

Reminder:

Any hazardous material that you put onto the ground or in your septic tank could potentially pollute the groundwater. Please help the Burns Point Water System prevent groundwater contamination for this and future generations.

Where does my water come from?

Your water is considered groundwater and is pumped into the system from three wells ranging in depth from 79 to 130 feet. Your water is not treated (no chlorination, filtration, pH adjustment, etc.)

Contaminants that may be present in source water include:

- ◆ **Microbial contaminants**, such as viruses, parasites and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations and wildlife.
- ◆ **Inorganic contaminants**, such as salts and metals, which can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming.
- ◆ **Pesticides and herbicides**, which may come from a variety of sources such as agriculture, urban stormwater runoff and residential uses.
- ◆ **Radioactive contaminants**, which can be naturally occurring or be the result of oil and gas production and mining activities.
- ◆ **Organic chemical contaminants**, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff and septic systems.

How To Read The Tables:

Your water is tested for more than 100 contaminants for which state and federal standards have been set. **Tables 1 & 2** list all primary contaminants that were detected (in any amount) along with their respective Maximum Contaminant Levels (MCLs). Primary standards protect public health by limiting the levels of these contaminants in drinking water. **Table 3** shows the levels of secondary contaminants and common water properties of interest to many consumers. Secondary contaminants have no known health effects but can affect the aesthetic properties of water (taste, odor and appearance). Secondary Maximum Contaminant Levels (SMCLs) are guidelines only.

Terms and Abbreviations used:

Maximum Contaminant Level Goal (MCLG): the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Contaminant Level (MCL): the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Action Level (AL): the concentration of a contaminant which, when exceeded, triggers treatment or other requirements which a water system must follow.

Lead and Copper 90th Percentile Value: Out of every 10 homes sampled, 9 were at or below this level. This must be \leq the AL or additional steps must be taken.

ppb: parts per billion. **ppm:** parts per million.
NTU: nephelometric turbidity unit

Sodium. Neither the EPA nor the WA State Board of Health have established an MCL for sodium but, due to concern for consumers who must restrict their dietary intake, your drinking water is monitored for sodium every 3 years (or every 9 years if an Inorganic Chemicals monitoring waiver was granted). The EPA recommends 20 ppm as a level of concern for those consumers who must restrict their intake. The highest detected level of sodium in your drinking water was last measured in 2004 at **13 ppm** (range = <5 to 13 ppm)^b.

Water Quality Data

TABLE 1: Primary Contaminants Detected In Your Drinking Water

Primary Contaminant	Units	Year Tested ^a	MCL	MCLG	YOUR WATER	Compliant? (Y/N)	Major Sources in Drinking Water
We are pleased to report that no new primary contaminants were detected, in <i>any</i> amount, in 2009! See footnote "a".							

TABLE 2: Lead and Copper Monitoring—Samples are collected at customer faucets. The number of homes sampled is based on population served by the system. Specific EPA-mandated criteria are used to select the

Primary Contaminant	Units	Year Tested	AL	No. of Homes Sampled	90th Percentile Value	No. of Homes Exceeding	Compliant? (Y/N)	Major Sources in Drinking Water
Copper	ppm	2007	1.3	5	0.05	0	Y	Corrosion of household plumbing systems; erosion of natural deposits
Lead	ppb	2007	15	5	< 2	0	Y	Corrosion of household plumbing systems; erosion of natural deposits

TABLE 3: Secondary Contaminants (Inorganic Chemical and Physical)

Secondary Contaminant	Units	Year Tested	SMCL	YOUR WATER ^b	Compliant?	Major Sources in Drinking Water
Iron	ppm	2004 ^a	0.30	< 0.1 - 0.27	Y	Leaching from natural deposits; industrial wastes
Manganese	ppm	2007 ^c , 2004 ^a	0.05	0.03 - 0.06	Y^d	Leaching from natural deposits
Chloride	ppm	2009	250	3 - 5	Y	Runoff/leaching from natural deposits; seawater influence
Hardness	ppm	2004 ^a	N/A	64 - 70^e	Y	Erosion of natural deposits
Conductivity	umhos/cm	2004 ^a	700	138 - 190	Y	Substances that form natural deposits; seawater influence
Turbidity	NTU	2004 ^a	N/A ^f	0.4 - 0.9	Y	Soil runoff
Color	color units	2004 ^a	15	5 - 10	Y	Naturally occurring organic materials

^a Except for nitrates, the most recent Inorganic Chemicals (IOC) testing was performed in 2004. All 3 wells were granted a 9-yr monitoring waiver for IOCs by the Dept of Health due to a history of good water quality data and because inorganic chemical quality of groundwater does not change much, if any, over time. With the waiver, only one complete IOC sample was required to be collected from each source between Jan 2002 - Dec 2010 and this was completed in 2004. The wells are not due to be tested again for IOCs until the next 9-yr monitoring cycle (2011-2019). Nitrates are tested annually and all three wells were < 0.02 mg/L in 2009 (no nitrate detected).

^b A range of values is shown because there are multiple wells on this water system and each is tested.

^c Well #1 was required to be tested for manganese in 2007 (0.06 ppm). Well #2 = 0.05 ppm & Well #3 = 0.03 ppm in 2004.

^d Secondary maximum contaminant levels (SMCLs) are guidelines only. Exceedance of an SMCL is not a violation.

^e Equivalent to 3.7 - 4.1 grains per gallon of hardness. 0 - 75 ppm hardness is considered "soft" water, 75-150 ppm is "moderately hard", 150-300 is "hard" and > 300 is "very hard".

^f 1.0 NTU is the state drinking water response level, meaning additional sampling or follow-up *may* be required if exceeded.

Your drinking water sources meet all applicable EPA and Dept of Health standards!

Synthetic Organic Chemicals (herbicides, pesticides and insecticides). In 2009, the Dept of Health (DOH) notified systems that any source that had not collected a general pesticides sample since January 1, 1999, would be required to collect both a pesticides and an herbicides sample before December 31, 2010. Sources S02 and S03 are now scheduled to be tested for pesticides and herbicides in August 2010. S01 was tested for pesticides and herbicides in 2007 (there were no detections) so will not have to be tested in the current 3-year monitoring period. Monitoring for insecticides has been waived altogether.

The Office of Drinking Water has compiled source water assessment program (SWAP) data for all community water systems in Washington. SWAP data for your system is available by accessing DOH's web site at:

<http://www4.doh.wa.gov/dw/swap/app/login.cfm?app=maps>

If you do not have access to the web, we encourage you to use the internet service available through the public library system.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immunocompromised people such as those with cancer undergoing chemotherapy, those who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline at (800) 426-4791, or by visiting their web site shown below.
