

## Our Water Quality Commitment:

### You Can Count on Washington Water Employees to . . .

- ⇒ provide you with the highest quality water possible
- ⇒ sample, test and treat your water on a regular basis
- ⇒ work diligently to meet every water quality standard on every system, every day
- ⇒ maintain water distribution system reliability
- ⇒ provide you with the highest level of customer service possible

WASHINGTON WATER SERVICE COMPANY

### Kooley's Harbor Estates Water System State ID #115142

## 2010 Drinking Water Report

Washington Water Service Company (WWSC) is committed to being a leader in providing communities and customers with traditional and innovative utility services. WWSC is proud of its service record and is staffed with courteous and knowledgeable water professionals who are dedicated to meeting your needs. While we are proud of our past record, we continually strive to improve upon the quality of services we provide to you, our valued customer.

This **2010 Drinking Water Report** is your annual update on the quality and safety of your drinking water. It includes the water quality monitoring results from the *most recent round* of testing done on your system, in accordance with state and federal regulations. This report also provides access through references and telephone numbers to source water assessments, health effects data and additional information about your water system. This allows you to make personal health-based decisions regarding your drinking water consumption and become more involved in decisions which may affect your health. We hope you find this information helpful!

## Regarding "contaminants" in drinking water:

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. In order to ensure that tap water is safe to drink, the Washington State Department of Health and EPA prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. The Food and Drug Administration (FDA) and the Washington State Department of Agriculture regulations establish limits for contaminants in bottled water that must provide the same protection for public health.

## Sources of drinking water:

Common sources of drinking water—both tap and bottled water—include rivers, lakes and streams (surface water) and wells and springs (groundwater). As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material. The water can also pick up substances resulting from the presence of animals or from human activity.

#### Reminder:

Any hazardous material that you put onto the ground or in your septic tank could potentially pollute the groundwater. Please help the Kooley's Harbor Estates Water System prevent groundwater contamination for

## Where does my water come from?

Your water comes from one well and is considered groundwater. The water is pumped into the system from this well, which is 160 feet deep. Your water is not treated (no chlorination, filtration, pH adjustment, etc.)

## Contaminants that may be present in source water include:

- ◆ **Microbial contaminants**, such as viruses, parasites and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations and wildlife.
- ◆ **Inorganic contaminants**, such as salts and metals, which can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming.
- ◆ **Pesticides and herbicides**, which may come from a variety of sources such as agriculture, urban stormwater runoff and residential uses.
- ◆ **Radioactive contaminants**, which can be naturally occurring or be the result of oil and gas production and mining activities.
- ◆ **Organic chemical contaminants**, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff and septic systems.

# Water Quality Data

## How To Read The Tables:

Your water is tested for more than 100 contaminants for which state and federal standards have been set. **Tables 1 & 2** list all primary contaminants that were detected (in any amount) along with their respective Maximum Contaminant Levels (MCLs). Primary standards protect public health by limiting the levels of these contaminants in drinking water. **Table 3** shows the levels of secondary contaminants and common water properties of interest to many consumers. Secondary contaminants have no known health effects but can affect the aesthetic properties of water (taste, odor and appearance). Secondary Maximum Contaminant Levels (SMCLs) are guidelines only.

## Terms and Abbreviations used:

**Maximum Contaminant Level (MCL):** the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

**Maximum Contaminant Level Goal (MCLG):** the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

**Action Level (AL):** the concentration of a contaminant which, when exceeded, triggers treatment or other requirements which a water system must follow.

**Lead and Copper 90th Percentile Value:** Out of every 10 homes sampled, 9 were at or below this level. This must be  $\leq$  the AL or additional steps must be taken.

**ppb:** parts per billion. **ppm:** parts per million.

**N/A:** not applicable

**Sodium.** Neither the EPA nor the WA State Board of Health have established an MCL for sodium but, due to concern for consumers who must restrict their dietary intake, your drinking water is monitored for sodium every 3 years. The EPA recommends 20 ppm as a level of concern for those consumers who must restrict their intake. Sodium in your drinking water was last measured in 2009 at **7 ppm**.

**TABLE 1: Primary Contaminants Detected In Your Drinking Water**

Primary Contaminant	Units	Year Tested	MCL	MCLG	YOUR WATER	Compliant? (Y/N)	Major Sources in Drinking Water
Nitrate	ppm	2009	10	10	<b>3.0</b>	<b>Y</b>	Runoff from fertilizer use; Leaching from septic tanks, sewage; Erosion of natural deposits
<b>Microbiological</b>					<b>Highest No. of Monthly Positives</b>		
Total coliform bacteria		2009	1 <sup>a</sup>	0	<b>5</b>	<b>N<sup>b</sup></b>	Naturally present in the environment

**TABLE 2: Lead and Copper Monitoring—Samples are collected at customer faucets. The number of homes sampled is based on population served by the system. Specific EPA-mandated criteria are used to select the**

Primary Contaminant	Units	Year Tested <sup>c</sup>	AL	No. of Homes Sampled	90th Percentile Value	No. of Homes Exceeding the AL	Compliant? (Y/N)	Major Sources in Drinking Water
Copper	ppm	2007	1.3	5	<b>1.3</b>	1 <sup>d</sup>	<b>Y<sup>d</sup></b>	Corrosion of household plumbing systems; erosion of natural deposits
Lead	ppb	2007	15	5	<b>3</b>	0	<b>Y</b>	Corrosion of household plumbing systems; erosion of natural deposits

**TABLE 3: Secondary Contaminants (Inorganic Chemicals and Physical Properties)**

Secondary Contaminant	Units	Year Tested	SMCL	YOUR WATER	Compliant? (Y/N)	Major Sources in Drinking Water
Iron	ppm	2009	0.30	<b>&lt; 0.1</b>	<b>Y</b>	Leaching from natural deposits; industrial wastes
Manganese	ppm	2009	0.05	<b>&lt; 0.01</b>	<b>Y</b>	Leaching from natural deposits
Chloride	ppm	2009	250	<b>5</b>	<b>Y</b>	Runoff/leaching from natural deposits; seawater influence
Hardness	ppm	2009	N/A	<b>100<sup>e</sup></b>	<b>Y</b>	Erosion of natural deposits

<sup>a</sup> For systems that collect < 40 coliform samples per month, the MCL is 1 positive (unsatisfactory) monthly sample.

<sup>b</sup> Coliforms are bacteria that are naturally present in the environment, harmless to the general population and are used as an indicator that other potentially-harmful bacteria *may* be present. Their presence is a warning of potential problems because disease-causing organisms may also enter the system via the same route as the coliforms. The presence of coliforms usually means that soil or vegetation has entered the system. Customers were notified of this Sept 2009 Non-Acute Coliform MCL Violation by notices dated and mailed on 10/15/09. The coliforms were determined to be originating in the well itself. From October 2009 through February 2010, the system was either served by the temporarily chlorinated Kooley's well or by an emergency intertie with Washington Water Service Company's (unchlorinated) Peacock Hill water system, as the water quality investigation continued. All monthly routine samples were absent of coliform bacteria during this time. In early March 2010, the well pump was removed and the well casing was inspected with a video camera and found to be heavily tuberculated with years of accumulated rust and scale which was making disinfection procedures ineffective. Nicholson Drillers scoured the well casing and removed the debris on 3/2/10. The well was disinfected with chlorine and all subsequent follow-up samples from the well and distribution mains have been absent of coliforms, including an increased number of monthly routine samples collected in March 2010.

<sup>c</sup> Most recent testing done, in accordance with the regulations (done every 3 years)

<sup>d</sup> The system is considered "optimized for corrosion control" if the 90<sup>th</sup> percentile value is less than or equal to the EPA Action Level. One of the five homes sampled had an elevated copper result (customer was notified) and this resulted in a 90th percentile value equal to the Action Level. Exceeding the Action Level is not a violation but the water system would be required to take additional steps (like follow-up sampling).

<sup>e</sup> Equivalent to 5.8 grains per gallon of hardness. 0-75 ppm hardness is considered "soft" water, 75-150 ppm is "moderately hard", 150-300 ppm is "hard" and > 300 ppm is "very hard".

**Synthetic Organic Chemicals (herbicides, pesticides and insecticides).** In 2009, the Dept of Health notified systems that any source that had not collected a general pesticides sample since January 1, 1999, would be required to collect both a pesticides and an herbicides sample before December 31, 2010. Your drinking water source is now scheduled to be tested for these chemicals in October 2010. Monitoring for insecticides is not required during this monitoring period.

The Office of Drinking Water has compiled source water assessment program (SWAP) data for all community water systems in Washington. SWAP data for your system is available by accessing DOH's web site at:

<http://www4.doh.wa.gov/dw/swap/app/login.cfm?app=maps>

If you do not have access to the web, we encourage you to use the internet service available through the public library system.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised people such as those with cancer undergoing chemotherapy, those who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline at (800) 426-4791.

More information about contaminants found in water and their potential health effects can be obtained by calling the Environmental Protection Agency's (EPA) Safe Drinking Water Hotline or by visiting their web site listed below.
